

It's 2045 on Planet Earth, Solar System.
In a galaxy not so far away...

Chronos

ITINERARIES

OUR FLEET

Each of our spacecrafts, propelled by the newest nuclear fusion engine, is composed of:

- An orbiter that will rotate around the most massive celestial bodies
- Mini shuttles that will lead you from the orbiter to the nearest planets and planetoids

HOW FAST CAN WE GO?

HOW MUCH WILL IT TAKE?

We will travel at $c/100$, that is, 1% of light's speed (approx. 3000 km/s). At that speed, we'll be able to get to Neptune in 17 days.

WHAT TO SEE AND DO

Reach the dwarf planet Eris and enjoy the view of its vast lands of frozen methane.

On Triton, visit the spectacular geysers erupting nitrogen, and watch the rise of Neptune in the skies.

WHAT TO SEE AND DO

Admire Haumea, the fastest-rotating body in the Solar System, and observe its unique oval shape and ring.

Marvel at Pluto's changing surface colors.

RESOURCES

The geysers on Triton are not only extraordinary to see: they could also be used as a source of renewable energy.

Makemake is rich in propane and tholins: the latter may be excellent UV shields in many applications.
