The main mission of aeronautical laboratories is the testing of structures , systems and materials to support:

- The aerospace research
- The aircraft development activities
- The aircraft certification activities

**SCUOLA POLITECNICA E DELLE SCIENZE DI BASE
DELL'UNIVERSITÀ «FEDERICO II»**

To demonstrate the compliance with design including use of models and critical locations and airworthiness requirements including specific environment condition in the above mission we perform:

Material Tests

Is fundamental the research of material allowables and validation of analytical formula describing their fatica and D.T. behaviour related to specific environmental factors (temperature, humidity) and furthermore to characterise their performance in terms of fire , smoke,toxicity.

Development Test

They are performed mainly on subcomponents to validate the design assumption when non conventional structure, with no much confidence on analytical models and not much experience of flight, have to be used (i.e. buckling and post-buckling of stiffened structure)

Certification Test

These tests are required from the certification normative to convalidate mathematical model used in the theoretical calculation , used material allowables ,and critical locations not theoreticaly analysed.

**SCUOLA POLITECNICA E DELLE SCIENZE DI BASE
DELL'UNIVERSITA' «FEDERICO II»**

- Material test, both for composite and metallic, mainly Ambient-Burning Mechanical Chemical

- System test mainly Acoustic-Electrical/Electronic- Equipment- Hydraulic&Pneumatic

**SCUOLA POLITECNICA E DELLE SCIENZE DI BASE
DELL'UNIVERSITÀ «FEDERICO II»**

- Structural test Static-Fatigue-Vibration-Impact

Compression Test

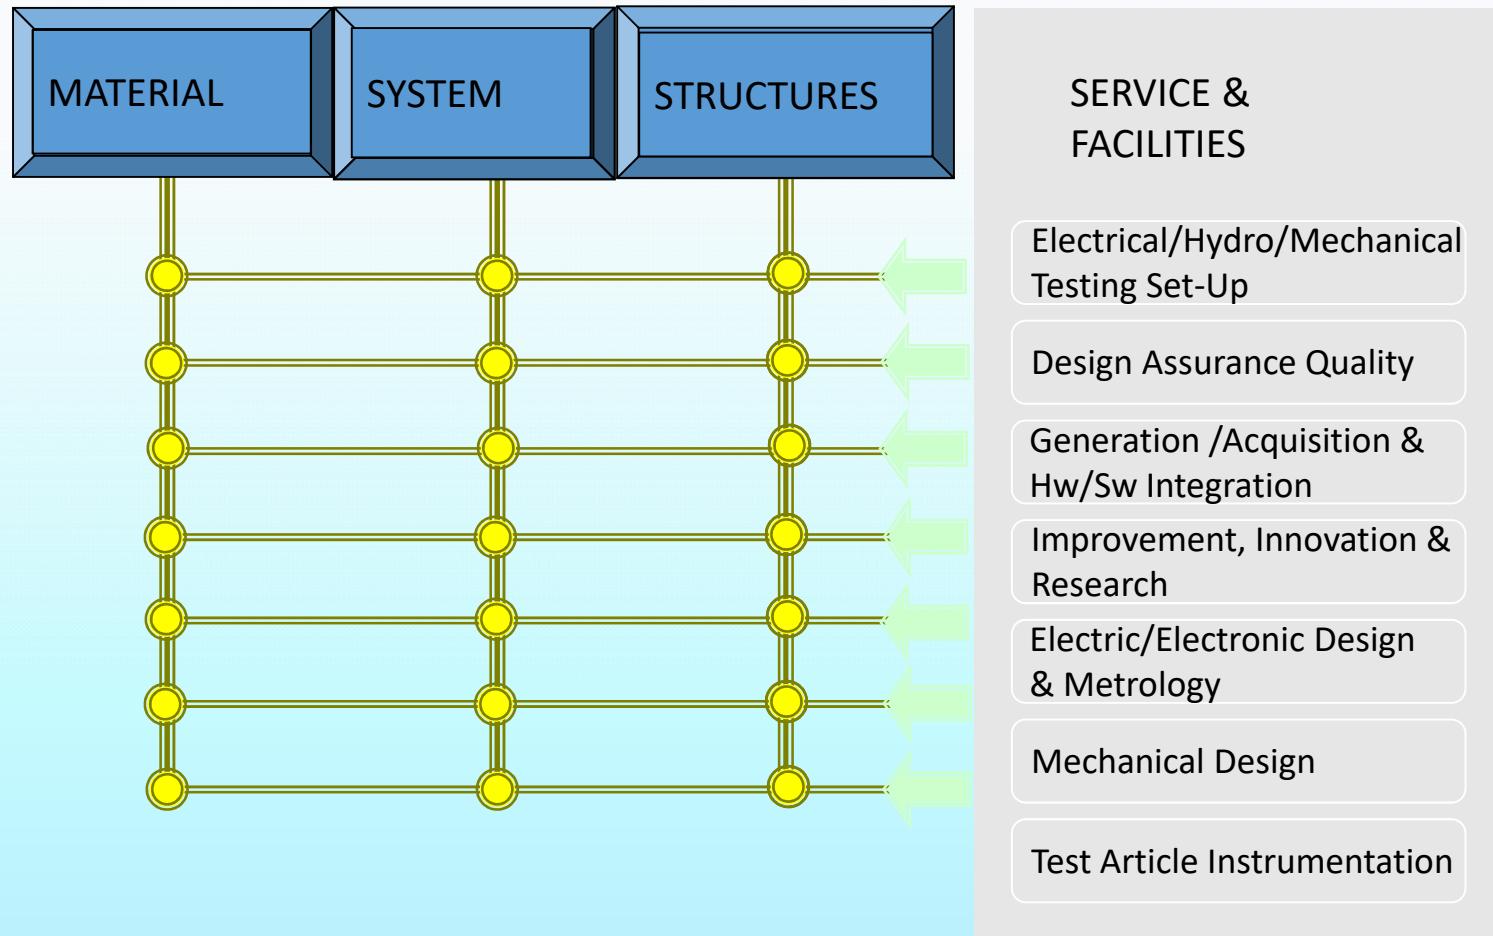

BOX Fatigue Test

“Large Panel Test”

EXTERNAL MACHINERY FEATURES

- Compression and Tension up to 4500 kN (1012 KIPS);
- Torque up to 6000 kN*m (53.1 MIPSIN)

- length 7.5 m max (25 ft)
- width 5 m (20 ft)
- height 6.5 m (21 ft)
- weight 60 metric tons
(66 short tons)

REMARKABLE PROGRESS IN THE LAST YEARS IN THE TEST FIELD:

- RELIABILITY AND PRECISION OF DATA (i.e. spectrum of load similar to the reality)
- ACQUIRE AND TO ANALYZE REAL TIME A MASSIVE STRUTURE OF DATA MORE AND MORE ELEVATED
- REDUCTION OF THE TIMES OF EXECUTION OF THE FATIGUE TEST.
